PDP Builder
How to use

Build product detail pages by dragging in sections, editing text and images, and exporting a ready-to-upload `{SKU}_en.html` with its images, in every language you need.

1 The screen at a glance

2 Start a page

3 Edit sections and elements

4 Columns, cards and layout

5 Images and file names

6 Desktop, tablet and mobile

7 Languages (EN · BM · ZH)

8 Import an existing page

9 Page settings

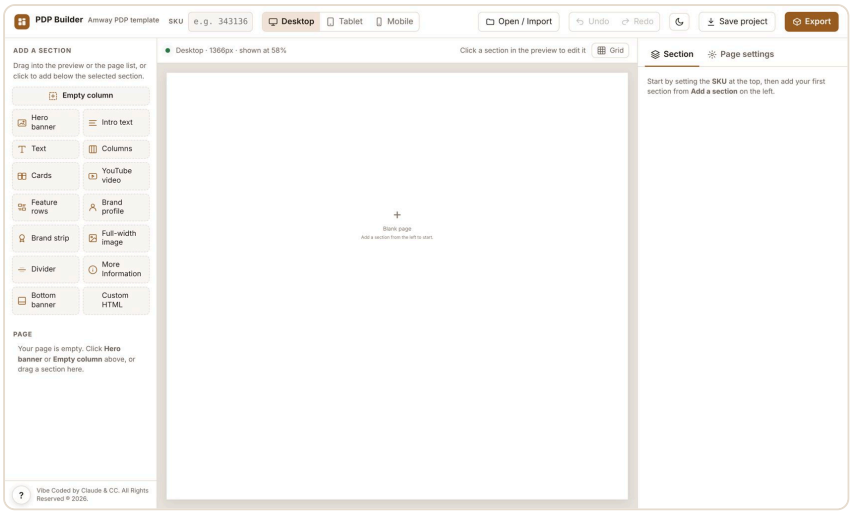

10 Save, autosave and open

11 Export and upload

12 Keyboard shortcuts

Vibe Coded by Claude & CC. All Rights Reserved ® 2026.

1 · The screen at a glance

A new page always starts blank.

AREA	WHAT IT DOES
Top bar	SKU, preview device (Desktop / Tablet / Mobile), Open / Import, Undo / Redo, light or dark theme, Save project and **Export**.
Add a section (left)	Section types. Click one to add it below the selected section, or drag it into the preview or the page list.
Page (left)	Your sections in order. Drag to reorder; use the arrows, duplicate and delete buttons on each row.
Preview (middle)	The page as it will look. Click anything to edit it. **Grid** (or `G`) shows alignment lines. The language picker appears when you add a language.
Section / Page settings (right)	Settings for the selected section, or for the whole page.
? (bottom left)	Keyboard shortcuts and a link to this guide.

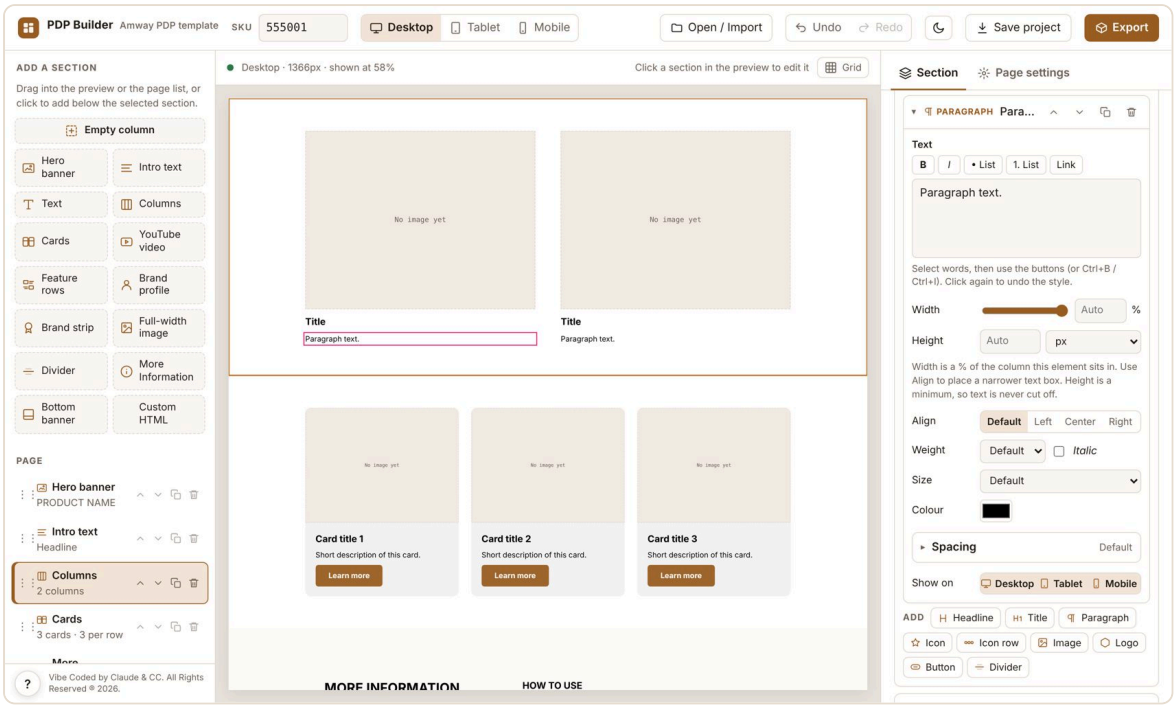

2 · Start a page

1. Type the product **SKU** in the top bar (for example `343136`). Every file name is based on it.
2. Add sections from **Add a section**. A typical page: Hero banner → Intro text → Feature rows or Columns → Cards → Divider → More Information → Bottom banner.
3. Click a section in the preview and fill in its text and images on the right.
4. Open **Page settings** and fill in the page title, meta description and keywords.
5. Press **Export**, fix anything the checks flag, and save the .zip.

> **Tip:** "Empty column" gives you a blank Columns section to build anything from scratch. "Divider" adds a ready-made line section.

3 · Edit sections and elements

Most sections are made of **elements**: Headline, Title, Paragraph, Icon, Icon row, Image, Logo, Button and Divider. Use the **Add** buttons under a list to add more, and the arrows, duplicate and delete buttons to manage them.

Clicking the paragraph in the preview opens its own settings on the right and outlines it in pink.

Click to edit

Click any element in the preview: the right panel jumps straight to that element's settings. Click the empty part of a column or card to open that column or card.

Text

- Select words and press **B**, **I**, lists or **Link** (or `Ctrl` + `B` / `Ctrl` + `I`).
- **Align**, **Weight**, **Italic**, **Size** and **Colour** per element. "Default" keeps the template style.

Size and spacing

- **Width** is a % of the column the element is in; **Height** is a minimum, so text is never cut off.
- **Spacing** adds space above / below and padding (px). It has Desktop, Tablet and Mobile tabs (see section 6).
- **Show on** hides an element on Desktop, Tablet or Mobile. Sections and columns have the same switch.

Buttons and dividers

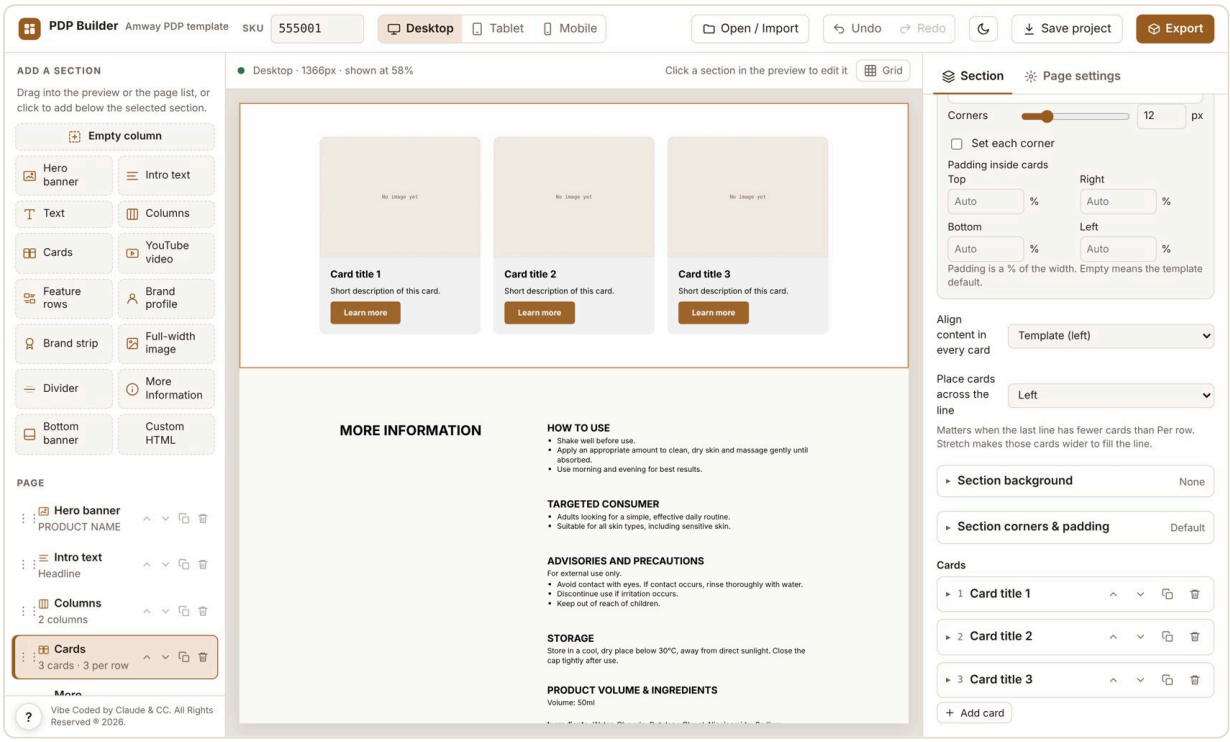

Buttons: text, link, optional icon, style (solid, gradient, outline with thickness, or a line under the text), corner radius and width (fit, full width or a custom %). Dividers: width, thickness, colour or gradient, round or square ends.

4 · Columns, cards and layout

Columns

- Add as many columns as you like; they wrap onto the next line. **Per line** sets how many fit on one line (default 6).
- Each column: width %, minimum height, background (colour, gradient or image), corner radius (all or each corner), padding, and **Content position** (a 3×3 grid).
- Section options: **Line up columns at** (top / middle / bottom), **Align content in every column**, and **Place columns across the line** (stretch, left, center or right).
- Gaps: between columns, between lines, and between elements.

Cards

Cards: image on top, with title, text and a button.

- **Style:** image on top, or image on the left (with an image-width slider).
- **Per row:** 1–6 on desktop. Tablet shows up to 2, mobile 1.
- **Card style** applies to all cards: background (colour, gradient, image), corners and padding.
- **Align content in every card** and **Place cards across the line** work like they do for columns.

Hero banner

Desktop: logo on the left (30%, adjustable) with title and text on the right, or **Stacked**. Tablet and mobile: everything stacks on the banner, centred by default, with its own position grid. Upload separate desktop, tablet and mobile banners, or let tablet and mobile reuse the desktop image.

5 · Images and file names

Every image slot is named automatically from the SKU, in page order, the same way the live pages are:

KIND	FILE NAME
Hero / bottom banner	`{SKU}_PDP_banner1.jpg`, `_tb_banner1`, `_mb_banner1`
Images	`{SKU}_PDP_img1.jpg`, `img2` …
Icons	`{SKU}_PDP_icon1.png` …
Logos	`{SKU}_PDP_logo.png`, brand strip `{SKU}_PDP_whitelogo.png`
Backgrounds	`{SKU}_PDP_bg1.jpg` …

Three ways to fill a slot

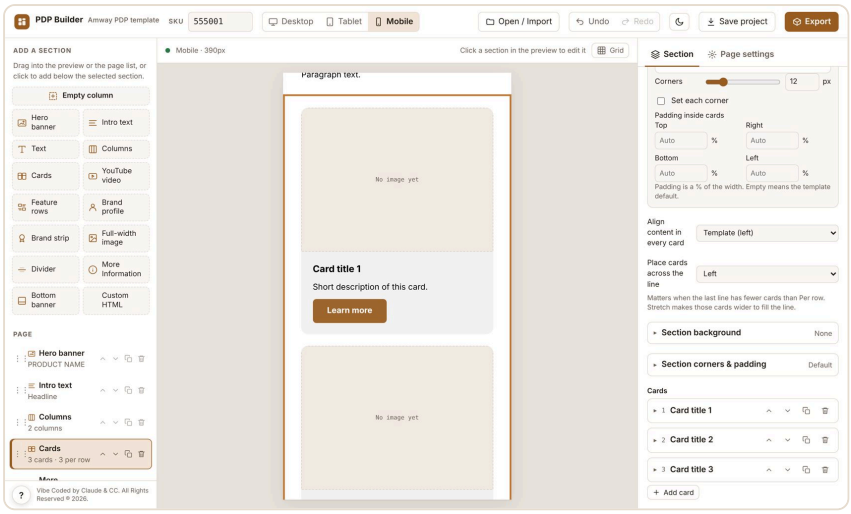

- **Upload** (or drop a file on the slot). It goes into the zip with the automatic name, or a name you type.
- **Use a file already on the server:** type its name, or paste the full link (right-click the image on the live page → *Copy image address*). Only the file name is kept and the zip skips it.
- If an upload has the **same name as a server file**, the page points to the server file and the zip skips it. New uploads never take an existing server name.

Formats

PNG, JPG, SVG, WebP, GIF and AVIF all work. HEIC (iPhone photos) does not: convert it to JPG first. Use PNG or SVG for icons and logos, JPG for photos and banners.

> **Tip:** the preview shows images that already exist on the server (Page settings → Server images in preview). This works when the builder is opened from GitHub; inside claude.ai outside images are blocked, so placeholders show instead.

6 · Desktop, tablet and mobile

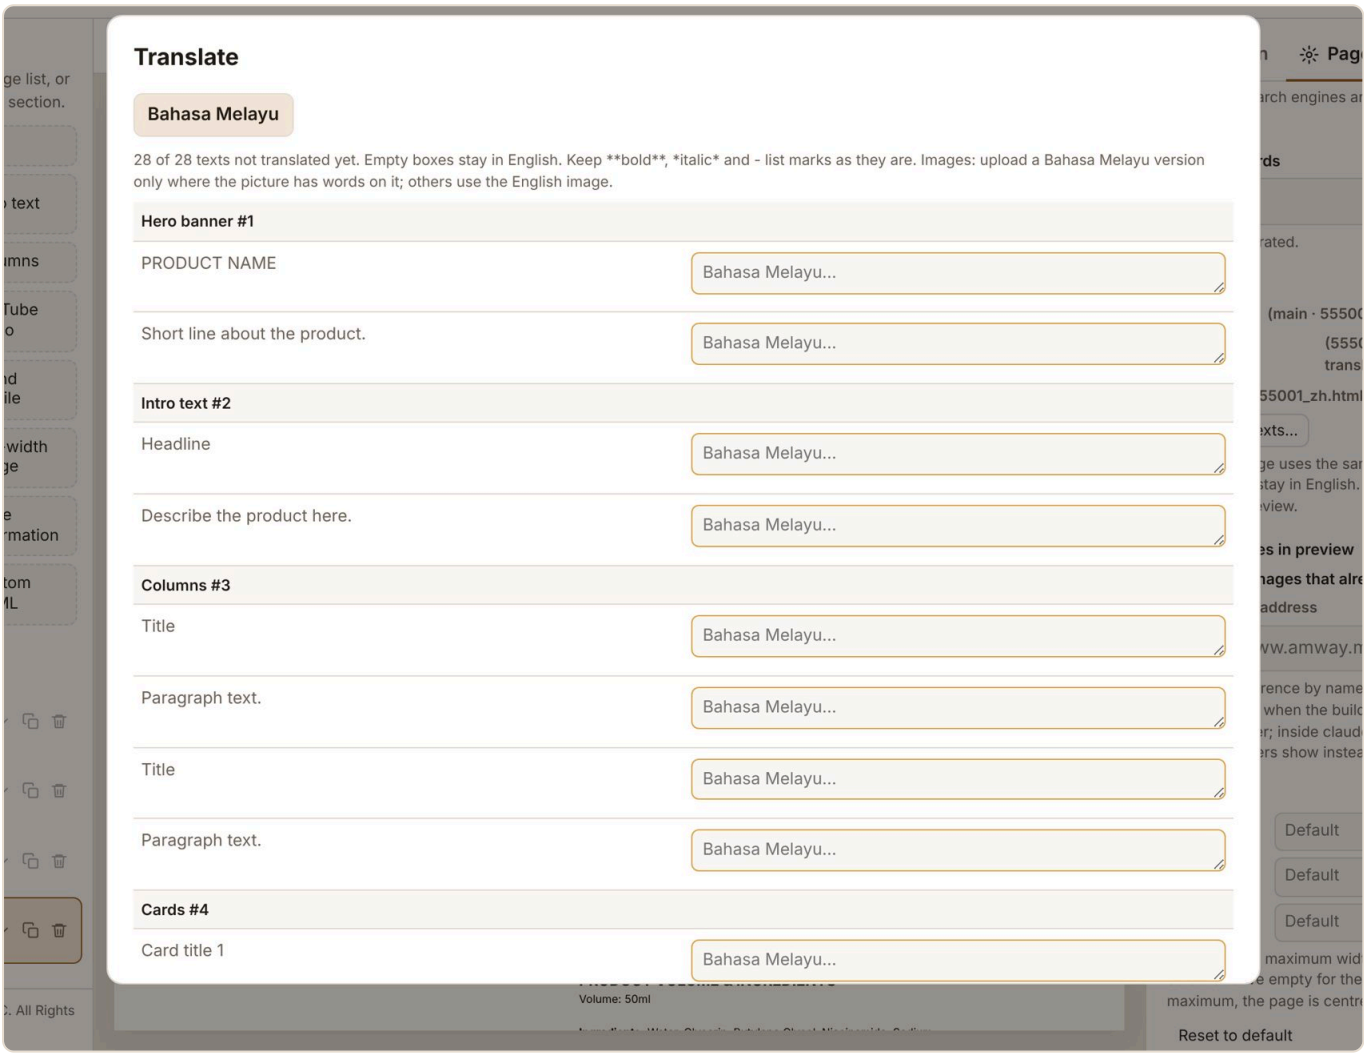

Preview in Mobile (390px).

- Switch the preview with the Desktop / Tablet / Mobile buttons (or `1` `2` `3`). Breakpoints: desktop above 1200px, tablet 769–1200px, mobile 768px and below.
- **Show on** hides a section, column, card or element on any device.
- An element's **Spacing** panel has Desktop / Tablet / Mobile tabs, with space above / below, padding, and width % for tablet and mobile. Tablet values also apply on mobile unless mobile has its own. A dot marks the tabs you set.
- **Page width** (Page settings) sets a minimum and maximum width per device. With a maximum, the page is centred.

7 · Languages (EN · BM · ZH)

1. Page settings → **Languages**: tick Bahasa Melayu and/or 中文.
2. Press **Translate texts…**. Each English text is on the left; type the translation on the right. Empty boxes stay in English.
3. Images with words on them: in the same window, upload a language version or type a server file name. Leave it empty to use the English image.
4. Pick the language in the preview's language menu to check it.

Translate window: texts and images grouped by section.

Export gives `{SKU}_en.html`, `{SKU}_bm.html` and `{SKU}_zh.html`, all with the same layout. Language images are named like `{SKU}_PDP_banner1_bm.jpg`. Keep `**bold**`, `*italic*` and `-` list marks when you translate.

8 · Import an existing page

Open / Import accepts a saved project or a live PDP page (`{SKU}_en.html`).

- **LIVARA-style pages** (like 343136) come in as editable sections: hero, intro, feature rows, brand, More Information and banners.
- **Other templates** (like 316733 or 341076): the builder asks how they should come in. **Keep exactly** keeps every section as Custom HTML, pixel-perfect. **Make editable** converts banners, repeated items, columns and More Information into builder sections; sections with a video, embed or form stay as HTML. `Ctrl` + `Z` returns to the exact version.
- **Every imported page keeps its own styles.** They are in Page settings → Page CSS and are exported as written.
- Any Custom HTML section can be turned into an editable one with **Convert to editable section**. A banner becomes a Hero banner; rows of columns become Columns; headings, text, images, lines and tables are kept. Colours and boxes from the old CSS may need restyling. `Ctrl` + `Z` undoes it.

Edit Custom HTML in place

- **Text:** click it in the preview and type. The bar above it has **B**, *I*, Link and Done; `Esc` cancels.
- **Images and videos:** click one to open it on the right. **Replace** uploads a new file with the same name (uploading the zip replaces it on the server); change the file name first to add it as a new file, or type a server file name to point at an existing one.
- **Anything else** (adding or removing parts): use the section's **HTML code** box, or Convert to editable section.
- Everything else, including layout and styles, stays exactly as the original. Switch the preview to English to edit; other languages are in Translate texts.

> **Tip:** import replaces the page you're working on. Undo brings it back, but save first if you need it.

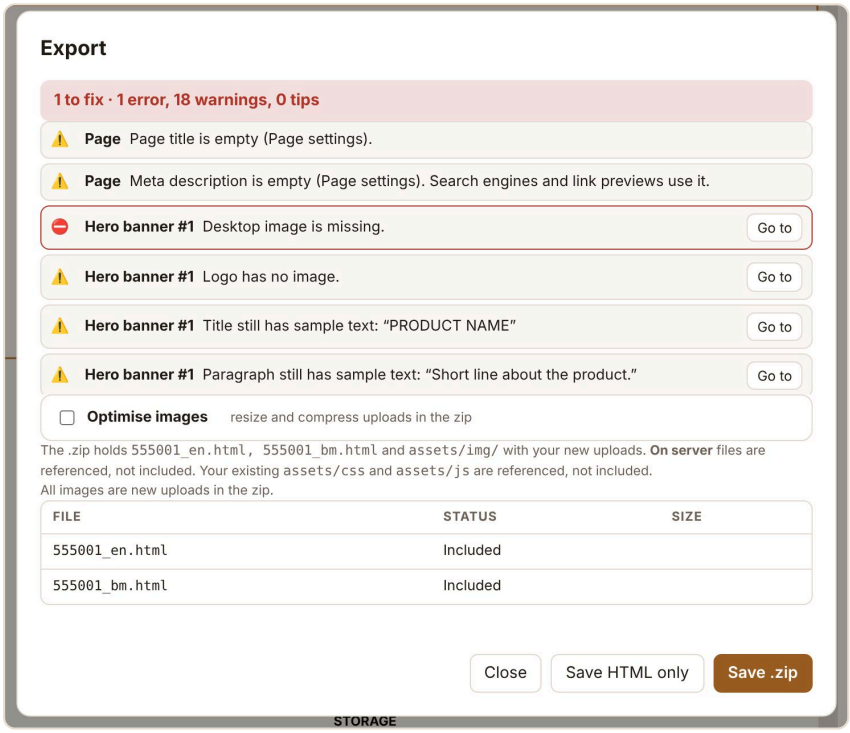

9 · Page settings

- **Page title, meta description, keywords**: used in the browser tab and by search engines.
- **Server images in preview** and the **image folder address** (default `https://www.amway.my/pdpcontent/MYBN/assets/img/`).
- **Languages** and **Translate texts…** (section 7).
- **Page width** per device (section 6).
- **Page CSS**: the styles of an imported page, kept and exported as written.

10 · Save, autosave and open

- **Save project** (`Ctrl` + `S`) downloads `{SKU}_project.html` with everything inside, uploads included. Open it later with **Open / Import**.
- **Autosave:** your work is kept in this browser as you go. If you close the tab by accident, reopen the builder and choose **Restore**.
- Autosave is per browser and device. To move work to another computer or share it, use Save project.
- **Undo / Redo** keeps the last 100 steps.
- **Pages made with the builder reopen fully editable.** Every exported page carries the builder data inside it (invisible on the live site), so **Open / Import** on a `{SKU}_en.html` brings back every section, translation and image name, even without the project file.

11 · Export and upload

Export window: checks, image optimisation and the file list.

1. Press **Export** (`Ctrl` + `E`). **Checks** list errors (fix them), warnings and tips; **Go to** jumps to the section.
2. The **server check** marks each server image ✅ Found or ⛔ Not on server. It needs the builder opened from GitHub, since claude.ai blocks the server.
3. Optional: **Optimise images** resizes and compresses uploads (mobile images are capped at 1080px).
4. **Save .zip**: every language page plus `assets/img/` with your new uploads. **Save HTML only** saves just the pages.
5. Upload the files to `pdpcontent/MYBN/`, keeping the `assets/img/` folder. The page uses the existing `assets/css` and `assets/js` on the server.

12 · Keyboard shortcuts

KEYS	ACTION
`⌘/Ctrl` `S`	Save project
`⌘/Ctrl` `O`	Open / import a file
`⌘/Ctrl` `E`	Export
`⌘/Ctrl` `Z`	Undo
`⌘/Ctrl` `⇧` `Z` or `⌘/Ctrl` `Y`	Redo
`⌘/Ctrl` `D`	Duplicate the selected element, or the section
`Delete` / `Backspace`	Delete the selected element, or the section
`↑` `↓`	Select the previous / next section
`1` `2` `3`	Preview Desktop / Tablet / Mobile
`G`	Grid lines on / off
`?`	Show the shortcut list
`Esc`	Close a window

Single keys do nothing while you are typing in a box. An element is "selected" after you click it in the preview.

Good to know

- The preview reloads for about a second after each change; a click during that second may be missed.
- Spacing in px is fixed; template spacing in vw grows with the screen.
- Open the builder from GitHub to see live server images and run the server check.
